## CHEMICAL ANALYZER FOR SULFUR

## ABSTRACT OF THE DISCLOSURE

5

10

A circulating flow of liquid gasoline is provided to a chemical analyzer for analyzing sulfur concentration. The chemical analyzer vaporizes and combusts a sample of the gasoline to provide an exhaust gas that includes sulfur dioxide produced by combusting the sulfur concentration. The exhaust gas is pressurized and delivered to a flame photometric detector which detects the sulfur dioxide concentration. The sulfur content is inferred from the sulfur dioxide concentration.
